Subject Name: Computer Organisation and Architecture

Credit: 4

Subject Code: MCA101

Lecture Hours: 40

Course Name: Computer Organisation and Architecture	
Course Code: MCA101	Semester: 1st
Duration: 40 Hrs.	Maximum Marks: 100
Teaching Scheme	Examination Scheme
Theory: 4	End Semester Exam: 100
Tutorial: 1	Continuous Assessment: 100
Credit: 4	

Aim:	
Sl. No.	
1	To have a thorough understanding of the basic structure and operation of a digital computer.
2	To study the different communication methods with I/O devices and standard I/O interfaces.
3	To learn the architecture and assembly language programming of 8085 microprocessor.

Objective:	
Sl. No.	
1	Understanding Logic gates, flip flops and counter.
2	Clear Understanding of Computer Architecture.
3	Clear Understanding of Pipeline processing, RISC and CISC architectures.
4	Develop a base for advanced microprocessors.
Pre-Requisite:	
Sl. No.	
1.	Proficiency in basic Digital Electronics
Course Outcome:	
CO1	Summarize the fundamental components of a basic computer system and its organization.
CO2	Apply arithmetic and logical microoperations of binary number systems.
CO3	Analyze control unit design and concept of pipelining.
CO4	Classify memory hierarchy and examine numerical problems based on it.

Subject Name: Computer Programming with C

Credit: 4

Subject Code: MCA102

Lecture Hours: 48

Course Name: Computer Programming with C & C Programming Laboratory	
Course Code: MCA102 & MCA192	Semester: 1st
Duration: 40 Hrs.	Maximum Marks: 100
Teaching Scheme	Examination Scheme
Theory: 4	End Semester Exam: 100
Tutorial: 1	Continuous Assessment: 100
Practical: 4	Practical Sessional Internal continuous evaluation: 100
Credit: 4+3	Practical Sessional external examination: 100
Aim:	
Sl. No.	
1	To develop a rigorous understanding of algorithmic problem-solving and translate abstract logic into structured C programs.
2	To cultivate the ability to write modular, efficient, and memory-safe code suited for postgraduate-level software development.
3	To establish a strong foundation in core programming constructs, memory management, and data handling as a stepping stone for advanced systems programming.
Objective:	
Sl. No.	

1	A foundational understanding of computer operations, mathematical logic, and an aptitude for computational problem-solving.
2	To impart an in-depth understanding of memory management, specifically through pointer arithmetic and dynamic memory allocation.
3	To demonstrate the practical implementation of user-defined data types (structures and unions) and secure string manipulations.
4	To foster critical computational thinking necessary for optimising code, debugging errors, and implementing file handling for data persistence.
Pre-Requisite:	
Sl. No.	
1.	Proficiency in one high-level programming language
Course Outcome:	
Upon successful completion of this course, students will be able to:	
C01	Apply algorithmic thinking and fundamental C programming constructs (control structures, operators) to translate mathematical and logical problems into executable code.
C02	Analyse computational problems to select and implement appropriate linear data structures (arrays, strings) for efficient data organisation and manipulation.
C03	Evaluate memory management and program modularity by leveraging pointers, dynamic memory allocation, and user-defined functions to optimise software performance.
C04	Design and develop comprehensive software solutions utilizing heterogeneous data types (structures/unions) and persistent file I/O operations for real-world data processing scenarios.

Annexure – I

Course Code: MCA102

Course Name: C Programming Lab

Week 1: Fundamentals, I/O, and Operators

Direct Questions:

1. Write a program using the `sizeof()` operator to print the memory footprint of `char`, `int`, `float`, and `double` on your current compiler architecture.
2. Write a program to swap the values of two variables without using a third temporary variable.
3. Write a program that takes an integer input from the user and uses bitwise operators to determine if the number is odd or even.

Story-Based Question: A new music streaming startup needs a basic bandwidth calculator to estimate server load. Write a program that asks the user for the number of active listeners, the average audio bitrate (in kbps), and the average song duration (in minutes). Calculate and display the total data transferred in Megabytes (MB).

Week 2: Control Structures

Direct Questions:

1. Write a menu-driven program using a `switch-case` statement to simulate a basic calculator. Handle the divide-by-zero edge case.
2. Write a program to print a right-angled pyramid pattern of numbers.
3. Write a program to check if a user-inputted number is an Armstrong number.

Story-Based Question: A local research team is analyzing epidemiological data to track a recent outbreak. Write a program that takes a patient's data as input: Age, Body Temperature, and Symptom Duration. Use an `else-if` ladder to classify their risk level as "Low," "Moderate," or "High" based on threshold conditions you define.

Week 3: Functions & Recursion

Direct Questions:

1. Write a function `isPrime(int n)` that returns 1 if prime and 0 otherwise. Print all prime numbers between 1 and 100.
2. Write a recursive function to calculate the Factorial of a given number.
3. Write a user-defined function `power(int base, int exp)` that calculates base exponentiation without using `<math.h>`.

Story-Based Question: For an upcoming university CyberX workshop, participants need a secure, dynamically generated passcode. Write a recursive function that takes a 4-digit ID and recursively sums the digits until a single digit is obtained. Multiply that digit by a security constant to generate the passcode.

Week 4: 1-D and 2-D Arrays

Direct Questions:

1. Write a program to find the second largest and second smallest elements in a 1D array of integers.
2. Write a program to perform Matrix Multiplication on two 3x3 matrices.
3. Write a program to reverse the elements of a 1D array *in-place*.

Story-Based Question: You are organizing an online Capture the Flag (CTF) programming competition. You have two separate, sequentially sorted arrays of competitor scores. Write a program to seamlessly interleave and merge these two arrays into a single sorted array to generate the final leaderboard.

Week 5: Strings & Secure Coding

Direct Questions:

1. Write a program to find the length of a string and reverse it without using standard library functions.
2. Write a program that takes a string input and counts the total number of vowels, consonants, digits, and whitespaces.
3. Write a program to check if two strings inputted by the user are anagrams.

Story-Based Question: You are formatting an academic research paper on XAI, and the publisher requires specific proprietary frameworks to be redacted. Write a program that reads a text using `fgets()`, searches for a target word (like "SHAP" or "LIME"), and replaces all its occurrences with asterisks (****).

Week 6: Pointers Fundamentals

Direct Questions:

1. Write a program to swap two variables using pass-by-reference.
2. Traverse a 1D integer array and print its elements using *only* pointer arithmetic.
3. Write a function that returns both the maximum and minimum values of an array via pointer parameters.

Story-Based Question: A smart wearable device tracks `heart_rate` and `step_count`. Write a function taking these variables by reference. If the `heart_rate` exceeds 150 BPM, reset the `step_count` to zero and double the `heart_rate` to trigger a hardware alert state.

Week 7: Dynamic Memory Allocation (DMA)

Direct Questions:

1. Use `malloc()` to allocate memory for an array of N integers. Populate, calculate the sum, and `free()` the memory.
2. Demonstrate `calloc()` by allocating memory for an array of floats and verifying initialization to zero.
3. Use `realloc()` to expand a dynamically allocated array of 5 integers to hold 10 integers.

Story-Based Question: An epidemiological prognosis system needs to load daily patient records. Write a program that asks for the current day's patient count, dynamically allocates the memory to store their ages, calculates the moving average age, and strictly ensures the memory is freed before termination.

Week 8: User-Defined Data Types

Direct Questions:

1. Define a `struct Employee` (`emp_id`, `name`, `salary`). Read and print data for one employee.
2. Create an array of `struct Student`. Read data for 5 students and print the details of the one with the highest marks.
3. Write a program demonstrating a `union`, showing how memory is shared and overwritten.

Story-Based Question: An online music learning platform manages its catalog using structures. Define a `Course` structure containing an inner `Pricing` structure. Create an array of 3 courses, calculate the final price after discounts for each, and display the course with the lowest final cost.

Week 9: File Handling & Command Line Arguments

Direct Questions:

1. Write a program using command-line arguments to copy the contents of one file into another.
2. Write a program to open a text file and count the number of lines, words, and characters.
3. Accept an integer via command-line and append its multiplication table to `table.txt`.

Story-Based Question: A cybersecurity digital footprint analyzer monitors network requests. Write a program that reads a mock log file. Extract any line containing the keyword "UNAUTHORIZED" and append it to a new file called `threat_report.txt`.

Weeks 10 & 11: Capstone Projects

Students must select **ONE** of the following 12 capstone projects to complete. These projects require the integration of multiple core concepts including Pointers, Structures, Dynamic Memory, and File Handling.

Project 1: The Epidemiological Prognosis Tracker

An epidemiological research lab needs a system to process daily patient metrics. Write a C program that reads a dataset of patients (Patient ID, Age, Body Temperature, Symptom Duration) from a file. Using structures and pointer manipulation, apply a rules-based threshold to identify high-risk cases. The program must automatically extract these flagged records and generate a formatted "Prognosis_Report.txt" for the clinical team.

Project 2: Music Startup Ecosystem Manager

A new startup focusing on musical education and talent discovery needs a backend inventory engine. The platform manages three distinct entities: "Learning Courses", "Instrument Access", and "Talent Profiles". Using arrays of structures and dynamic memory allocation (`malloc/realloc`), build a menu-driven program that allows administrators to add new courses, update instrument availability, and display a sorted list of registered musical talents.

Project 3: CyberX Digital Footprint Analyzer

Following the successful conclusion of a CyberX cybersecurity workshop, the server generated a massive log file of network access requests. Write a command-line application that parses this "digital footprint" text file line by line. Using advanced string manipulation, the program must extract unique IP addresses, count their frequency, and quarantine any log entry containing the word "UNAUTHORIZED" into a separate secure text file.

Project 4: Capture The Flag (CTF) Auto-Scorer

You are tasked with building the backend scoring engine for an upcoming university Hackerrank-style CTF competition. Competitor data (Team Name, Challenges Solved, Time Penalties) is continuously updated. Use pointers to structures to manage the team data. Write a dynamic sorting algorithm that instantly updates the leaderboard based on net scores and displays the top 3 teams in real-time on the console.

Project 5: Explainable AI (XAI) Feature Importance Matrix

In machine learning, algorithms like SHAP and LIME output feature importance scores. Write a C program that simulates this by generating a 2D matrix of floating-point numbers representing "feature weights" for a dataset. Calculate the row-wise and column-wise averages. Apply a user-defined threshold to identify the most critical data features, extracting their indices into a 1D dynamically allocated array using pointers.

Project 6: University Event Poster Layout Generator

The Department of Computer Applications frequently hosts workshops and competitions. Write a text-based layout generator that takes user input for an event (Title, Date, Time, Venue, Speaker Name). Using string formatting, loop constructs, and standard I/O padding, the program must generate a visually appealing ASCII-art "poster" layout and save it as a text file to be distributed to the MCA students.

Project 7: Supermarket Inventory & Billing System

Build a robust point-of-sale system for a local supermarket. Define a structure for `Product` (ID, Name, Price, Stock). The program should allow a cashier to input purchased item IDs and quantities. It must check stock availability, calculate the total bill including a 5% GST, update the remaining inventory using pass-by-reference, and print an itemized receipt to the console.

Project 8: Advanced Cryptographic Secure Messaging

Design a two-way secure messaging utility. The program takes a string message from the user and a numeric encryption key. Implement a custom encryption algorithm that applies a Caesar Cipher shift followed by a bitwise XOR operation on every character. The program must be able to output the encrypted ciphertext, and conversely, take ciphertext and the key to decrypt it back to the original message.

Project 9: The Hospital Blood Bank Matcher

A regional hospital requires a fast blood-matching registry. Store donor records (Name, Blood Group, Age, Contact) in a binary file using `fwrite()`. When an emergency trauma request comes in, the user inputs the required blood type and units needed. The program must rapidly search the binary file using `fread()`, identify eligible donors, and output their contact information, ensuring all file pointers are securely closed.

Project 10: Dynamic Library Book Allocator

A university library's new acquisitions arrive in unpredictable batch sizes. Write a program that initially allocates memory for an array of 5 `Book` structures (Title, Author, ISBN). As the user inputs new books, if the array becomes full, use `realloc()` to dynamically double the array size without losing previous entries. Implement a function to safely `free()` the entire catalog when the program terminates.

Project 11: Railway Route & Seat Manager

Design a train ticketing system for a specific route. Define a structure for passenger tickets. Manage a 1D array representing 50 available seats. The menu-driven application must allow users to view available seats, book a specific seat number, cancel a ticket, and display the final passenger manifest. Prevent double-booking using logical condition checks.

Project 12: MCA Gradebook & SGPA Calculator

Create a comprehensive gradebook application for the 1st-semester MCA cohort. The program reads a file containing student Roll Numbers and marks in 5 subjects. Using user-defined functions, calculate the total marks, percentage, and SGPA for each student based on the university's grading scale. The application must generate individual text-file "report cards" named dynamically (e.g., "Report_Roll101.txt").

University of Engineering and Management

Institute of Engineering & Management, New Town Campus

Subject Name: Data Structure with C

Credit: 4

Code: MCA103

Lecture Hours: 40

Name of the Course: Data Structure with C & Data Structures Laboratory using C	
Course Code: MCA103 & MCA193	Semester: 1 st
Duration: 40 Hrs.	Maximum Marks: 100
Teaching Scheme	Examination Scheme
Theory: 4	End Semester Exam: 100
Tutorial: 1	Continuous Assessment: 100
Practical: 3	Practical Sessional Internal continuous evaluation: 100
Credit: 4+3	Practical Sessional external examination: 100

Aim:	
Sl. No.	
1	To gain Knowledge of Various aspects of algorithm development
2	To enhance Ability to identify qualities of a good solution
3	To implement learned algorithm design techniques and data structures to solve problems.
Objective:	
Sl. No.	
1	The fundamental design, analysis, and implementation of basic data structures.
2	Basic concepts in the specification and analysis of programs.

3	Principles for good program design, especially the uses of data abstraction.
4	Significance of algorithms in the computer field
Pre-Requisite:	
Sl. No.	
1.	Proficiency in one high level programming language
Course Outcome:	
CO1	On completion of this course students are expected to learn various data structures, their usages, merits and limitations.
CO2	On completion of this course students are expected to design and analyze various algorithms.
CO3	On completion of this course students are expected to do a comparative analysis among different data structures and decide on the appropriate data structure to be used in a given scenario.
CO4	On completion of this course students are expected to acquire adequate knowledge and skills to solve a real life software problem.

Industry Mapping: The concepts delivered are in sync with the industry standards

- d) Insert a node at the end of a single linked list.
 - e) Insert a node before a given node of a single linked list.
 - f) Insert a node after a given node of a single linked list.
 - g) Delete a node from the beginning of a single linked list.
 - h) Delete a node from the end of a single linked list.
 - i) Delete a node after a given node of a single linked list.
 - j) Delete the entire single linked list.
2. Write a Menu driven C program to accomplish the following functionalities in circular linked list.
- a) Create a circular linked list.
 - b) Display the elements of a circular linked list.
 - c) Insert a node at the beginning of a circular linked list.
 - d) Insert a node at the end of a circular linked list.
 - e) Delete a node from the beginning of a circular linked list.
 - f) Delete a node from the end of a circular linked list.
 - g) Delete a node after a given node of a circular linked list.
 - h) Delete the entire circular linked list.
3. Write a Menu driven C program to accomplish the following functionalities in doubly linked list.
- a) Create a doubly linked list.
 - b) Display the elements of a doubly linked list.
 - c) Insert a node at the beginning of a doubly linked list.
 - d) Insert a node at the end of a doubly linked list.
 - e) Insert a node before a given node of a doubly linked list.

					f) Insert a node after a given node of a doubly linked list. g) Delete a node from the beginning of a doubly linked list. h) Delete a node from the end of a doubly linked list. i) Delete a node after a given node of a doubly linked list. j) Delete the entire doubly linked list. 4. Write a Menu driven C program to accomplish the following functionalities in circular doubly linked list. a) Create a circular doubly linked list. b) Display the elements of a circular doubly linked list. c) Insert a node at the beginning of a circular doubly linked list. d) Insert a node at the end of a circular doubly linked list. e) Delete a node from the beginning of a circular doubly linked list. f) Delete a node from the end of a circular doubly linked list. g) Delete a node after a given node of a circular doubly linked list. h) Delete the entire circular doubly linked list.
4	Linear Data Structure-Stack	Introduction, Stack Operations – Push, Pop, Peek, Representation of Stack (Array, Linked List), Application of Stack: Reversing a list, Parentheses checker, Conversion of an infix expression into a postfix expression, Evaluation of a postfix expression, Conversion of an infix expression into a prefix Expression, Evaluation of a prefix expression, Recursion, Tower of Hanoi	International Academia: https://web.stanford.edu/class/cs97si/03-data-structures.pdf AICTE-prescribed syllabus: https://makauteexam.net/aicte_details/Syllabus/MCA/se m221.pdf Industry Mapping: The concepts delivered are in	8	1. Write a Menu driven C program to accomplish the following functionalities in Stack using an Array: a. Insert an element into the stack using an array (Push Operation). b. Delete an element from the stack using an array (Pop Operation). c. Return the value of the topmost element of the stack (without deleting it from the stack) using an array. d. Display the elements of a stack using an array. 2. Write a Menu driven C program to accomplish the following functionalities in Stack using

			sync with the industry standards		Linked List: - Insert an element into the stack using a Linked List (Push Operation). - Delete an element from the stack using a Linked List (Pop Operation). - Return the value of the topmost element of the stack (without deleting it from the stack) using a Linked List. - Display the elements of the stack using a Linked List. - Write a program to convert an infix expression into its equivalent postfix notation. - Write a program to convert an infix expression into its equivalent prefix notation. - Write a program to evaluate a postfix expression. - Write a program to evaluate a prefix expression. - Write a program to print the Fibonacci series using recursion. - Write a program to solve the tower of Hanoi problem using recursion
5	Linear Data Structure-Queue	Introduction, Queue Operations – Enqueue, Dequeue, Peep, Representation of Queue (Array, Linked List), Types of Queues- Circular Queue, Deque, Priority Queue, Multiple Queue; Various operations (Enqueue, Dequeue, Peep) on the above mentioned queues-Both iterative & recursive implementation; Application of Queue	International Academia: https://web.stanford.edu/class/cs97si/03-data-structures.pdf AICTE-prescribed syllabus: https://makauteam.net/aicte_details/Syllabus/MCA/se m221.pdf Industry Mapping: The concepts delivered are in sync with the industry standards	8	- Write a Menu driven C program to accomplish the following functionalities in Queue using an Array: - Insert an element into the queue using an array (Enqueue Operation). - Delete an element from the queue using an array (Dequeue Operation). - Return the value of the FRONT element of the queue (without deleting it from the queue) using an array (Peep operation) - Display the elements of a queue using an array. - Write a Menu driven C program to accomplish the following functionalities in Queue using Linked List: - Insert an element into the queue using a Linked List (Enqueue Operation). - Delete an element from the queue using a Linked List (Dequeue Operation). - Return the value of the FRONT element of

					the queue (without deleting it from the queue) using a Linked List (Peep operation). d. Display the elements of a queue using a Linked List. 3. Write a Menu driven C program to accomplish the following functionalities in Circular Queue using Array: - Insert an element into the circular queue. - Delete an element from the circular queue. - Return the value of the FRONT element of the circular queue (without deleting it from the queue). Display the elements of a circular queue using the circular queue
6	Searching & Sorting	Searching- Types of Searching (Linear Search, Binary Search, Interpolation Search), Comparison among various Searching techniques Sorting-Types, Methods (Bubble Sort, Insertion Sort, Selection Sort, Quick Sort, Merge Sort), Technique, Explanation, Algorithm and Examples on various sorting methods, Comparison of various sorting algorithms in terms of time complexity (Average case, Worst case)	International Academia: https://web.stanford.edu/class/cs97si/03-data-structures.pdf AICTE-prescribed syllabus: https://makautexam.net/aicte_details/Syllabus/MCA/se m221.pdf Industry Mapping: The concepts delivered are in sync with the industry standards	8	- Write a C program to implement the concept of Bubble sort. - Write a C program to implement the concept of Selection sort. - Write a C program to implement the concept of Insertion sort. - Write a C program to implement the concept of Quick sort. - Write a C program to implement the concept of Merge sort. - Write a C program to show that Quick sort is better than Bubble sort. - Write a C program to show that merge sort is more effective than quick sort. - Write a C program to search an element in an array using linear search. - Write a C program to search an element in an array using binary search. - Write a C program to search an element in an array using interpolation search.

Subject Name: Business English and Communication

Credit: 3

Subject Code: MCA105

Lecture Hours: 33

Name of the Course: Business English and Communication	
Course Code: MCA105	Semester: 1
Duration: 33	Maximum Marks: 100
Teaching Scheme	Examination Scheme
Theory: 3	End Semester Exam: 100
Tutorial: 1	Continuous Assessment: 100
Credit: 3	

Aim:	
Sl. No.	
1	Making the students industry-ready.
2	Making the students relevant in the contemporary society.
3	Making the students prepared to analyze and solve problems through listening, speaking, reading and writing skills.
Objective:	
Sl. No.	
1	To develop effective business writing and communication skills.
2	To enhance oral communication and presentation abilities among students.
3	To help students learn to prepare various business documents and technical reports.
4	To improve listening and reading comprehension.
Pre-Requisite:	

Sl. No.	
1.	Basic English Proficiency, Listening and Speaking Skills, Reading and Writing Skills, Academic and Social Contexts, and Familiarity with Corporate Ethics.
Course Outcome:	
CO1	Achieve competence in grammar, syntax, and vocabulary fundamentals.
CO2	Effectively communicate in academic and social contexts.
CO3	Develop readiness for the industry and understand corporate ethics.
CO4	Acquire basic proficiency in English encompassing reading, listening, comprehension, writing, and speaking skills.

Subject Name: Computational Mathematics and Statistics

Credit: 4

Lecture Hours: 48

Subject Code: MCA106

Course Name: Computational Mathematics and Statistics	
Course Code: MCA106	Semester: 1 st
Duration: 48 Hrs.	Maximum Marks: 100
Teaching Scheme	Examination Scheme
Theory: 4	End Semester Exam: 100
Tutorial: 1	Continuous Assessment: 100
Credit: 4	

Aim:	
Sl. No.	
1	To provide a rigorous foundation in discrete mathematical structures, including set theory and propositional logic, which are essential for software development and formal methods.
2	To develop analytical and statistical problem-solving skills necessary for data-driven computing, focusing on probability distributions, parameter estimation, and statistical hypothesis testing.
3	To introduce advanced mathematical concepts like fuzzy sets and generating functions that underpin modern computational fields such as artificial intelligence, soft computing, and operations research.

Objective:	
Sl. No.	
1	Introduce the fundamental concepts of relations, functions, and propositional logic (including CNF and DNF) to formulate formal computational models and logic circuits.
2	Equip students with combinatorial tools, including the inclusion-exclusion principle, and mathematical induction techniques necessary for analyzing algorithm design and cryptography.
3	Teach foundational statistical measures, probability distributions (Binomial, Poisson, Normal), and hypothesis testing methods (z-test, t-test, chi-squared test, ANOVA) required for machine learning and numerical analysis.
4	Explore advanced mathematical frameworks, specifically generating functions for solving recurrences and fuzzy set operations for applications in financial modeling and soft computing.
Pre-Requisite:	
Sl. No.	
1.	A fundamental understanding of high-school-level algebra and introductory algorithmic thinking to effectively grasp abstract logic, recurrences, and numerical computations.
Course Outcome:	
Upon successful completion of this course, students will be able to:	
CO1	Apply the principles of set theory, mathematical relations, and propositional logic to solve foundational discrete computational problems and model logic circuits.
CO2	Analyze combinatorial problems and algorithm constraints using permutations, combinations, and the principle of mathematical induction.
CO3	Evaluate datasets and statistical models by selecting and applying appropriate probability distributions and hypothesis testing methods (large and small sample tests) to assess data consistency and error.
CO4	Formulate computational solutions for complex systems using advanced mathematical models, such as generating functions for recurrences and fuzzy sets for artificial intelligence applications.

University of Engineering and Management
Institute of Engineering & Management, New Town Campus

Syllabus for MCA Admission Batch 2026, 1st Semester

Subject Name: RESEARCH METHODOLOGY AND IPR

Credit: 02

Subject Code: MCA171

Lecture Hours: 36 Hrs.

Name of the Course: RESEARCH METHODOLOGY AND IPR	
Course Code: MCA171	Semester: FIRST
Duration: 36	Maximum Marks: 100
Teaching Scheme	Examination Scheme
Theory: 2	End Semester Exam: 100
Tutorial: 1	Continuous Assessment: 100
Credit: 2	

Aim:	
Sl. No.	
1	To develop comprehensive understanding of research methodologies and systematic approaches to academic inquiry
2	To foster awareness of intellectual property rights and their application in research and development
3	To equip students with practical skills for conducting ethical and legally compliant research

Objective:	
Sl. No.	
1	To enable students to formulate well-defined research problems and design appropriate research frameworks
2	To provide knowledge of various data collection methods and their appropriate application in different research contexts
3	To develop competency in data analysis techniques and interpretation of research findings
4	To instil understanding of IPR principles, patent processes, and research ethics in academic and industrial settings
Pre-Requisite: Basic understanding of statistics and data interpretation. Familiarity with computer applications and software tools. Foundational knowledge of research concepts and academic writing	
Course Outcome:	
CO1	Formulate and design a research problem.
CO2	Understand and Comprehend the Data Collection Methods
CO3	Perform Data analysis and acquire Insights.
CO4	Understand IPR and follow research ethics.

COs	PO1	PO2	PO3	PO4	PO5	PO6	PO7	PO8	PO9	PO10	PO11	PO12	PSO1	PSO2	PSO3

University of Engineering and Management

Institute of Engineering & Management, New Town Campus

Syllabus for MCA Admission Batch 2026, 1st Semester

Subject Name: Basic Python Programming

Credit: 3

Subject Code: MCA172

Lecture Hours: 40

Name of the Course: Basic Python Programming	
Course Code: MCA172	Semester: 2nd
Duration: 40 Hrs.	Maximum Marks: 100
Teaching Scheme	Examination Scheme
Sessional: 2	End Semester Exam: 100
Practical: 3	Credit: 2

Aim:	
Sl. No.	
1	To provide a strong foundation in Python programming language and computational problem-solving.
2	To introduce procedural, modular, and object-oriented programming constructs available in Python.
3	To develop practical skills in building real-world applications using Python's standard library, file I/O, and database connectivity.

Objective:	
Sl. No.	
1	Understanding the basic syntax, variables, expressions, data types, and operators of Python.
2	Clear understanding of control flow constructs (conditionals, loops) and user-defined functions.
3	Proficient use of Python's core data structures — lists, tuples, dictionaries, and sets.
4	Understanding of modules, packages, file I/O, and exception handling in Python.
5	Develop a base for Object-Oriented Programming and modern application development using Python.

Pre-Requisite:	
Sl. No.	
1.	Basic knowledge of computer fundamentals.
2.	Familiarity with any introductory programming language (preferably C).
Course Outcome:	
CO1	Understand Python fundamentals including data types, operators, and control-flow constructs.
C02	Develop modular Python programs using functions, scope rules, recursion, and standard library modules.
CO3	Apply Python's core data structures (lists, tuples, dictionaries, sets) along with file I/O and exception handling to solve real-world problems.
CO4	Design object-oriented solutions using classes, objects, inheritance, polymorphism, and constructors.

Module-wise Syllabus Distribution

Module number	Topic	Sub-topics	Mapping with Industry and International Academia	Lecture Hours
1	Fundamentals & Basics	Introduction to Python: history, features, interpreter, interactive and script mode. Variables, expressions, statements, identifiers, keywords, comments. Standard data types: Numbers (int, float, complex), Booleans, Strings — basic string operations and slicing. Operators: arithmetic, relational, logical, assignment, bitwise, and membership operators. Input/output functions and type conversion.	International Academia: https://web.stanford.edu/class/cs41/ AICTE-prescribed syllabus: https://www.aicte-india.org/downloads/mcadegree.pdf Industry Mapping: The concepts delivered are in sync with industry standards for software development, data science, and automation.	7
2	Control Flow & Functions	Conditionals: if, else, elif, nested conditional statements. Loops: while and for loops, use of range(), break, continue,	International Academia: https://web.stanford.edu/class/cs41/ AICTE-prescribed syllabus:	8

Module number	Topic	Sub-topics	Mapping with Industry and International Academia	Lecture Hours
		and pass statements. Functions: defining and calling functions, parameters and arguments (positional, keyword, default), return statement, local vs. global scope, lambda functions, recursion.	https://www.aicte-india.org/downloads/mcadegree.pdf Industry Mapping: The concepts delivered are in sync with industry standards for software development, data science, and automation.	
3	Core Data Structures (Collections)	Lists: creation, indexing, slicing, built-in methods, mutability, nested lists, list comprehension. Tuples: immutability, packing/unpacking, tuple methods. Dictionaries: key-value pairs, accessing and modifying elements, dictionary methods, dictionary comprehension. Sets: creation, set operations (union, intersection, difference), set methods.	International Academia: https://web.stanford.edu/class/cs41/ AICTE-prescribed syllabus: https://www.aicte-india.org/downloads/mcadegree.pdf Industry Mapping: The concepts delivered are in sync with industry standards for software development, data science, and automation.	9
4	Modules, Exception Handling & File I/O	Functions (advanced): keyword and default arguments, global/local scope, recursion (revisited). Modules: importing modules, from-import, packages, introduction to the Python Standard Library (math, random, os, datetime). Exception Handling: try/except/finally, handling common errors, raise statement, built-in exceptions, user-defined exceptions. File I/O: opening, reading, writing, and closing text and binary files; working with file pointers.	International Academia: https://web.stanford.edu/class/cs41/ AICTE-prescribed syllabus: https://www.aicte-india.org/downloads/mcadegree.pdf Industry Mapping: The concepts delivered are in sync with industry standards for software development, data science, and automation.	9
5	Advanced Programming (OOP)	Object-Oriented Programming in Python: classes and objects, attributes and methods, constructors (__init__), self parameter. Inheritance (single, multiple, multilevel), method overriding, polymorphism, encapsulation, abstraction. Introduction to modern tools: CRUD operations with MongoDB / building a simple web page with Django (project-level exposure).	International Academia: https://web.stanford.edu/class/cs41/ AICTE-prescribed syllabus: https://www.aicte-india.org/downloads/mcadegree.pdf Industry Mapping: The concepts delivered are in sync with industry standards for software development, data science, and automation.	7

List of Books			
Text Books:			
Name of Author	Title of the Book	Edition/ISSN/ISBN	Name of the Publisher
John V. Guttag	Introduction to Computation and Programming Using Python	3rd Edition	MIT Press / PHI
Sheetal Taneja	Python Programming: A Modular Approach	1st Edition	Pearson Education
Reference Books:			
Robert Sedgewick, Kevin Wayne, Robert Dondero	Introduction to Programming in Python: An Interdisciplinary Approach	1st Edition	Pearson / Addison-Wesley
Mark Lutz	Learning Python	5th Edition	O'Reilly Media
Allen B. Downey	Think Python: How to Think Like a Computer Scientist	2nd Edition	O'Reilly Media

Lab Assignments (MCA291)

Basics & Control Flow

1. Temperature Conversion: Write a program to convert Celsius to Fahrenheit and vice versa.
2. Prime Numbers: Check if a number is prime or print all primes in a given range.
3. Fibonacci Series: Generate the series up to n terms using loops or recursion.
4. Pattern Printing: Use nested loops to print star or number patterns.

Data Structures

5. List Operations: Create a list and perform operations like append, remove, sort, and find the largest/smallest element.
6. String Manipulation: Implement programs for vowel counting, string slicing, and palindrome checking.
7. Dictionary Application: Develop a student record system using names as keys and grades as values.

Advanced Concepts

8. Search & Sort: Implement Linear Search, Binary Search, and Selection or Bubble Sort.
9. OOP: Create a “Bank Account” or “Library Management” system using classes, objects, and inheritance.
10. File Handling: Read from and write to a text file (e.g., counting word frequency or reversing file contents).

Project / Modern Tools

11. Basic CRUD operations using MongoDB with Python.
12. Build a simple web page using the Django framework.

Story-based Assessment Questions (Unit 1 – Unit 5)

Unit 1: Fundamentals — The Online Store

Story: You are building a checkout system for a digital store. A customer buys an item with a price P and a tax rate T (percentage). Write a program to calculate the final price after adding tax and then applying a flat discount of ₹50.

Concepts: *Variables, Arithmetic Operators, Type Conversion.*

- Test Case 1: Price = 500, Tax = 10% → Expected Output: ₹500.0 (calculated as $500 + 50 - 50$)
- Test Case 2: Price = 100, Tax = 5% → Expected Output: ₹55.0 (calculated as $100 + 5 - 50$)

Unit 2: Control Flow & Functions — The Smart Fitness Tracker

Story: Your fitness tracker needs to give you a message based on your daily steps. Write a function `check_goal(steps)` that returns “Goal Reached” if steps are 10,000 or more, “Keep Walking” if between 5,000 and 9,999, and “Sedentary” if below 5,000.

Concepts: *Functions, if-elif-else, Comparison Operators.*

- Test Case 1: steps = 12000 → Expected Output: “Goal Reached”.
- Test Case 2: steps = 4500 → Expected Output: “Sedentary”.

Unit 3: Core Data Structures — The Movie Theater

Story: You have a list of available seats in a theater: `seats = [10, 12, 15, 20, 22]`. A user wants to book a specific seat number. Write a program that checks if the seat is available. If it is, remove it from the list and print “Booked”; otherwise, print “Unavailable”.

Concepts: *Lists, List Methods (remove, in operator).*

- Test Case 1: User Choice = 15 → Expected Output: “Booked”, Updated List: [10, 12, 20, 22].
- Test Case 2: User Choice = 11 → Expected Output: “Unavailable”.

Unit 4: Files & Exceptions — The Grade Reporter

Story: You are reading a file `grades.txt` that contains a list of numbers. Some lines might accidentally contain text instead of numbers. Write a program that reads the file, converts each line to an integer, and calculates the total sum. Use exception handling to skip any line that is not a valid number.

Concepts: *File I/O (open, readlines), try-except, ValueError.*

- Test Case 1: File contents `80\n90\nABC\n70` → Expected Output: Total Sum: 240 (skips ‘ABC’).
- Test Case 2: File is missing → Expected Output: “Error: File not found”.

Unit 5: Advanced Programming — The Virtual Bank

Story: Create a class BankAccount with an initial balance. It should have a method withdraw(amount) that reduces the balance but only if there are sufficient funds. If funds are insufficient, print “Insufficient Balance”.

Concepts: *OOP (Classes, Objects, Methods, self).*

- Test Case 1: Initial Balance = 1000, Withdraw = 400 → Expected Output: Balance: 600.
- Test Case 2: Initial Balance = 500, Withdraw = 600 → Expected Output: “Insufficient Balance”.
